

ICB-0-3

Adenocarcinoma, papillary and infiltrating 8503/3

Site Code breast, NOS C50.9 1/10/11 hr

Patient:

Surgical Pathology

Surg Path

CLINICAL HISTORY:

year old white female with right subareolar breast mass times 3 month.
Right breast carcinoma.

GROSS EXAMINATION:

A. "Right breast mass-wide local excision" in formalin. The specimen consists of a portion of breast tissue with a skin ellipse and nipple. The skin ellipse measures 9 x 3.5 cm. The underlying breast tissue measures 10 x 4 x 4 cm. The outer surface was inked in blue. Directly beneath the skin ellipse is a 2.5 x 2 x 1.5 cm mass composed of tan firm friable tissue with focal areas of hemorrhage. The mass is sharply circumscribed. The mass is 0.8 cm from the deep surgical margin.

Block Summary:

A1: Section of nipple.

A2-A11: Section of mass including deep surgical margin.

MICROSCOPIC EXAMINATION:

Large portions of the tumor are made up of well-formed papillary tumor with fibrovascular cores lined by malignant, stratified, complicated, epithelium. In addition, cribriform and tubular foci infiltrate desmoplastic fibrous tissue.

This case was reviewed by Dr.

DIAGNOSIS:

A. "RIGHT BREAST MASS- WIDE LOCAL EXCISION":

INVASIVE PAPILLARY ADENOCARCINOMA OF BREAST (2.5 CM IN GREATEST DIAMETER).
MARGINS OF RESECTION ARE FREE OF TUMOR
